Subject: Personal Reflection

Establish clear interfaces. When building up our really large codebase, we realized that it was physically impossible to remember how every single class and method worked. By defining clear interfaces and treating the class implementations as black boxes, we were able to more easily extend our existing features as well as create code that used existing classes. Also, trusting the existing interfaces and trying to avoid major fixes became super important for us. When we got the new code base, there were a couple major things we wanted to change but, logistically, we just didn't have the time.

Best,

Marina Karr and Kevin Liang
